2004 Precision Planted Corn Performance Trials

Robert G. Hall, Extension Agronomist,
Project Leader, Crop Performance Testing

&

Kevin K. Kirby, Agricultural Research Manager,
Crop Performance Testing

This publication reports the performance of entries in the 2004 South Dakota corn hybrid performance trials for both non-Roundup-Ready™ and Roundup-Ready™ hybrids. Information includes both the most recent 2-year and 1-year grain yields in bushels per acre (bu/ac); and 1-year bushel weight, moisture percentages of shelled corn at harvest, acre harvest population, and stalk lodge percentages. These performance trials are conducted by the South Dakota Crop Performance Testing (CPT) program at South Dakota State University.

Test Trial Locations

Trial locations, soil types, and seedbed preparation are indicated in Table A, while cooperators and seeding dates are shown in Table B. Seeding started April 30 and was completed May 7, 2004.

Weather Conditions

Weather data (Table C) for this year's growing season, April-September, was obtained from the 2004 USDA-South Dakota Crop-Weather reports and the South Dakota Automatic Weather Data Network (SD-AWDN).

Heat unit or growing-degree-day (GDD) accumulations are reported for the nearest test site in place of temperatures. Corn hybrids typically express a certain thermal or heat unit requirement from emergence to black-layer formation (physiological maturity). The heat unit totals across test locations varied from a high of 2,829 GDD at Armour to a low of 2,032 GDD at Brookings.

GDD seasonal accumulations were below average for all test locations in 2004. Deficits ranged from a low range of 96 to 165 units at Huron, Centerville, Armour, and Brookings to a higher range of 304 to 333 units at Watertown and Aberdeen. Generally, across all locations, cooler than normal temperatures resulted in below-normal levels of heat units during July and August. At Aberdeen and Watertown cooler than normal temperatures were evident in May and June.

Precipitation accumulation varied greatly across test locations. Seasonal total precipitation from April 1 through the end of September was highest at Huron and Brookings and lowest at Aberdeen and Armour. On average the seasonal precipitation accumulations were above average at all locations. Precipitation seasonal accumulations ranged from 1.62 inches at Armour to 7.67 inches at Huron. Precipitation deficits of 0.12 to 1.0 inches were evident in April at most locations. Later in the season deficits of 0.88, 1.3, and 1.35 inches were evident at Watertown, Beresford, and Armour, respectively.

In summary, moisture deficits in July and August likely reduced yields at Armour. A more normal or above-normal moisture distribution in July and August likely resulted in higher yields at the other locations. The seasonal GDD totals across this region were below normal for 2004. At Aberdeen, Brookings, and Watertown, temperatures were cooler than normal in May and June. These cooler temperatures were often accompanied by overcast clouds and little effective sunlight. At Brookings these overcast conditions lasted nearly 3 weeks.

The assistance of the following is appreciated: Glenda Piechowski at Brookings, Jim Smolik and Allen Heuer at the NE Research Farm, Todd Bortnem and the Brookings Agronomy Farm staff, and Bob Berg and the SE Research Farm staff; and farmer-cooperators Mark and Cletus Wiechmann (Armour), Kirk Aughenbaugh (Iroquois), and Allen and Inel Ryckman (Warner).

General Test Procedures

Participating companies pick the test locations where their entries are tested. Entries are placed into "early" or "late" maturity trials. The arbitrary relative maturity breaks between the early and late tests are as follows: 95 days for Warner and South Shore; 100 days for Yale and Brookings; 105 days for Armour; and 110 days for Beresford. A hybrid is assigned to a maturity trial based on its relative maturity rating reported by the participating seed company.

This testing program does not guarantee that all entries are placed in the proper maturity trial. In some trials, borderline entries with relative maturity ratings at or near the arbitrary break between the early and late trials may crossover at a given location. In some cases this may be indicated by exceptionally high or low grain moisture contents at harvest. A higher-than-average moisture content may indicate the hybrid is later in relative maturity than indicated. Likewise, a lower-than-average moisture may indicate the hybrid is earlier in relative maturity than indicated.

A fee was charged for all entries at each location. A list of participating seed companies for 2004 is presented in Table F.

Experimental Procedures

Entries were seeded in three replications with each hybrid randomly located within each trial. Plots consisted of four 30-inch rows that were 20 feet long. The center two rows were harvested for yield. A Monosem precision row crop planter was used for seeding plots at all locations. In 2004, the planter was calibrated and delivered 27,878 seeds per acre, regardless of seed quality and germination percentage. No seeding rate adjustment was made for low germination. Therefore, the acre harvest population is an indication of initial seed quality and the ability of the seed to cope with the production environment from seeding to harvest.

Soil type, land preparation, and previous crop at each test site are outlined in table A. Seedbed preparation was good at all locations. A starter fertilizer of 100 pounds/acre of 37-18-00 was applied 2 inches below and 2 inches to the side (2 x 2) of the seed row. Force™ insecticide was applied down the seed tube at label rates for corn rootworm control this year. In addition, Pounce™ granular was applied at labeled rates down the whorl with a tractor mounted granular applicator just prior to canopy closure.

The experimental procedures described above apply both to the non-Roundup Ready™ and the Roundup Ready™ hybrid corn trials with one exception: Weed control in the Roundup Ready™ trials consisted of two post emergence applications of Roundup Ultra™ (32 oz/acre): first, when weeds were 2-4 inches tall; and second, when weed growth was again 2-4 inches tall. In non-Roundup Ready™ test trials, pre-emergence herbicides consisted of Harness Extra™ (1.0 qt/ac) at Warner, South Shore, and Iroquois; Dual™ at Brookings; and Balance™ (3.0 oz/ac) at Armour. Post emergence herbicide applications included Accent/Buctril™ at Brookings, Armour, and Warner, at labeled rates.

Measurements of Performance

Yield. Yields are an average of three replications and are expressed as bushels per acre adjusted to 15.5% moisture on a dry-matter basis and a bushel weight of 56 lb.

Hybrids of equal potential may yield differently because of variations in slope, soil fertility, and stand. Statistical tests were conducted to determine whether differences obtained

were caused by variations in environment or were true variety differences. In 2004, the coefficient of variation (CV) for yield was within reasonable limits across all locations. The CV value in a given test trial is a measure of experimental error associated with the test trial. Ideally, this value should not exceed 15%. In cases where the CV value exceeds 15% it is recommended that the test data be used with caution in making hybrid selection decisions.

Experimental error may be the result of several factors, including test methods; moisture, temperature, and soil variations; agronomic factors like seeding date, reseeding; or seed quality factors; all of which may or may not be controllable in a given year.

Grain moisture content. Moisture content is expressed as the percentage of moisture in the shelled corn at harvest. Moisture is inversely related to maturity, and because maturity is of prime importance in South Dakota, moisture figures are of considerable importance in the evaluation of trial entries. Hybrids that provide satisfactory yields and can be stored without additional drying are desirable. During harvest, random moisture values as determined by the on-board moisture meter on the combine were checked with a Dickey-John GAC II to verify that the on-board moisture meter was within calibration limits.

Use of tables. Check for the “least significant difference” (LSD) value at the bottom of each column of data averages. The LSD value indicates how much a variable such as yield must differ between two hybrids before there is a real yield difference. An LSD value is given at the bottom of every column where there is significant difference among the averages within a given column. If there are no real differences among the averages within a given column a “non-significant” (NS) difference designation is indicated.

The LSD values reported in this publication can be used in two ways. In this publication the LSD value is used primarily to identify the top group for current year and 2-year yields, bushel weight, grain moisture at harvest, green snap percentage, and stalk lodging below the ear percentage for each test trial.

For example, at South Shore (Table 1a) the highest current year yield was 163 bu/ac for Dekalb/DKC40-05. To determine whether it is the only top yielding hybrid at South Shore, use the LSD value of 11 bu/ac indicated at the bottom of the 2004 yield column. For hybrids to be in the top yield group they must yield 152 bu/ac (163 - 11 = 152) or higher. Technically, a yield value of 153 bu/ac is in the top yield group while a value of 152 bu/ac is not in the top yield group. However, all yields and LSD values are rounded to the nearest whole number. We can say 152 bu/ac, because of the rounding-off, is the more appropriate minimum value for top yield hybrids at the “early” maturity test at South Shore in 2004. In addition, the minimum top group value is indicated for the 2-year (2003-04) average unless there were no significant yield differences. Top yield hybrids for 2004 are those hybrids that are equal or higher than the

minimum top group value indicated at the bottom of the 2004 yield column. In cases where hybrid yield differences are not significant (NS), then by definition all hybrids in the test are in the top-yield group for the stated 1 or 2 years.

Likewise, the top group for other performance factors like bushel weight, percent grain moisture at harvest, percent stalk lodging below the ear, and final population in plant per acre (ppa) can be determined. For example, at South Shore in 2004 (Table 1b), to qualify for the top performance group (TPG), a hybrid must have a bushel weight of 52 lb or higher and a final population of 24,249 ppa or higher. Likewise, to qualify for the top performance group a hybrid must have a grain moisture of 23% or less and a lodging value of 2% or less.

Note that yield, bushel weight, and final population (ppa) top performance group values must be greater than a certain yield, bushel weight, or final population value; while grain moisture and lodging below ear percentages must be equal to or less than a certain percentage to qualify for the TPG. Again, as with hybrid yields, if there are no hybrid differences for a given performance factor, then by definition

all hybrids in the test are in the top group for that performance factor for the current year.

In addition, the top yield group LSD values can also be used to determine whether two hybrids differ in performance. For example, in the early test at South Shore (Table 1a); the LSD value of 11 bu/ac can be used to compare the yields of any two hybrids in the trial. If hybrid A yields 163 bu/ac and hybrid B yields 153 bu/ac their yield difference is 10 bu/ac ($163 - 153 = 10$). In this case the two hybrids do not differ in yield because their yield difference of 10 bu/ac is equal to or less than the reported LSD value of 11 bu/ac. In contrast, if hybrid C yields 151 bu/ac, the yield difference between hybrids A and C is 12 bu/ac ($163 - 151 = 12$). In this case the yield difference of 12 bu/ac is more than the reported LSD value of 11 bu/ac; therefore hybrid A would have a significantly higher yield than hybrid C. Similarly, the LSD values for bushel weight, grain moisture, stalk lodging below the ear, and final population (ppa) can be used to determine if any two hybrids differ in these performance factors.

Performance Trial Results: Conventional Hybrids

Northern Locations

Early maturity corn tests:

South Shore, Tables 1a and b. The test trial yield average (Table 1a) was 148 bu/ac for year 2004 and 117 bu/ac for 2 years (2003-04). Hybrids that yielded 152 bu/ac or more in 2004 and 118 bu/ac or more for 2 years qualified for the top yield group. Hybrids had to differ in yield by 11 bu/ac in 2004 and by 10 bu/ac for 2 years to be significantly different from one another. In 2004, bushel weights averaged 51 lb, grain moisture averaged 28%, lodging averaged 1%, and the final plant population averaged 26,826 ppa (Table 1b). For a hybrid to be in the top performance group for these factors it had to equal 52 lb or higher in bushel weight, 23% or less in grain moisture, 2% or less in stalk lodging, and 24,249 ppa in final population. This final population of 24,249 ppa was the lowest population; however, the differences in final population were non-significant (NS). The minimum top performance final population of 24,249 ppa was 87% ($24,249/27,878$) of the population delivered at planting.

Warner, Tables 1a and b. The test trial yield average (Table 1a) was 224 bu/ac for year 2004 and 217 bu/ac for 2 years

(2003-04). Hybrids that yielded 227 bu/ac or more were in the top yield group for 2004. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 208 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 15 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 57 lb, grain moisture averaged 20%, lodging averaged 2%, and the final plant population averaged 27,287 ppa (Table 1b). For a hybrid to be in the top performance group for these factors it had to equal 57 lb or higher in bushel weight, 18% or less in grain moisture, 7% or less in stalk lodging, and 27,040 ppa in final population. The minimum top performance final population of 27,040 ppa was 97% ($27,040/27,878$) of the population delivered at planting.

Late maturity corn tests:

South Shore, Tables 2a and b. The test trial yield average (Table 2a) was 130 bu/ac for year 2004 and 99 bu/ac for 2 years (2003-04). Hybrids that yielded 161 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years,

even the lowest yield of 86 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 13 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 50 lb, grain moisture averaged 34%, lodging averaged 2%, and the final plant population averaged 27,349 ppa (Table 2b). For a hybrid to be in the top performance group for these factors it had to equal 49 lb or higher in bushel weight, 28% or less in grain moisture, 3% or less in stalk lodging, and 25,991 ppa in final population. The minimum top performance final population of 25,991 ppa was 93% (25,991/27,878) of the population delivered at planting.

Warner, Tables 2a and b. The test trial yield average (Table 2a) was 218 bu/ac for year 2004 and 202 bu/ac for 2 years (2003-04). Hybrids that yielded 218 bu/ac or more in 2004 and 199 bu/ac or more for 2 years qualified for the top yield group. Hybrids had to differ in yield by 15 bu/ac in 2004 and by 14 bu/ac for 2 years to be significantly different from one another. In 2004, bushel weights averaged 54 lb, grain moisture averaged 23%, lodging averaged 1%, and the final plant population averaged 27,152 ppa (Table 2b). For a hybrid to be in the top performance group for these factors it had to equal 54 lb or higher in bushel weight, 22% or less in grain moisture, 3% or less in stalk lodging, and 25,555 ppa in final population. The minimum top performance final population of 25,555 ppa was 92% (25,555/27,878) of the population delivered at planting.

Central Locations

Early maturity corn tests:

Brookings, Tables 3a and b. The test trial yield average (Table 3a) was 191 bu/ac for year 2004 and 189 bu/ac for 2 years (2003-04). Hybrids that yielded 195 bu/ac or more in 2004 and 186 bu/ac or more for 2 years qualified for the top yield groups. Hybrids had to differ in yield by 12 bu/ac in 2004 and by 10 bu/ac for 2 years to be significantly different from one another. In 2004, bushel weights averaged 54 lb, grain moisture averaged 21%, lodging averaged 1%, and the final plant population averaged 27,072 ppa (Table 3b). For a hybrid to be in the top performance group for these factors it had to equal 54 lb or higher in bushel weight, 19% or less in grain moisture, 3% or less in stalk lodging, and 26,965 ppa in final population. The minimum top performance final population of 26,965 ppa was 97% (26,965/27,878) of the population delivered at planting.

Iroquois, Tables 3a and b. The test trial yield average (Table 3a) was 194 bu/ac for year 2004 and 147 bu/ac for 2 years (2003-04). Hybrids that yielded 189 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 125 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 29 bu/ac in

2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 61 lb, grain moisture averaged 17%, lodging averaged 2%, and the final plant population averaged 26,959 ppa (Table 3b). For a hybrid to be in the top performance group for these factors it had to equal 61 lb or higher in bushel weight, 16% or less in grain moisture, 6% or less in stalk lodging, and 27,177 ppa in final population. The minimum top performance final population of 27,177 ppa was 97% (27,177/27,878) of the population delivered at planting.

Late maturity corn tests:

Brookings, Tables 4a and b. The test trial yield average (Table 4a) was 187 bu/ac for year 2004 and 184 bu/ac for 2 years (2003-04). Hybrids that yielded 192 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 169 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 15 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 52 lb, grain moisture averaged 27%, lodging averaged 1%, and the final plant population averaged 26,739 ppa (Table 4b). For a hybrid to be in the top performance group for these factors it had to equal 53 lb or higher in bushel weight, 21% or less in grain moisture, 3% or less in stalk lodging, and 25,748 ppa in final population. The minimum top performance final population of 25,748 ppa was 92% (25,748/27,878) of the population delivered at planting.

Iroquois, Tables 4a and b. The test trial yield average (Table 4a) was 202 bu/ac for year 2004 and 146 bu/ac for 2 years (2003-04). Hybrids that yielded 197 bu/ac or more in 2004 and 142 bu/ac or more for 2 years qualified for the top yield group. Hybrids had to differ in yield by 36 bu/ac in 2004 and by 19 bu/ac for 2 years to be significantly different from one another. In 2004, bushel weight averaged 58 lb, grain moisture averaged 19%, lodging averaged 3%, and the final plant population averaged 26,866 ppa (Table 4b). For a hybrid to be in the top performance group for these factors it had to equal 58 lb or higher in bushel weight, 20% or less in grain moisture, 8% or less in stalk lodging, and 26,310 ppa in final population. The minimum top performance final population of 26,310 ppa was 94% (26,310/27,878) of the population delivered at planting.

Southern Locations

Early maturity corn tests:

Beresford, Tables 5a and b. The test trial yield average (Table 5a) was 235 bu/ac for year 2004 and 210 bu/ac for 2 years (2003-04). Hybrids that yielded 244 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years,

even the lowest yield of 205 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 15 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 60 lb, grain moisture averaged 19%, lodging averaged 1%, and the final plant population averaged 27,429 ppa (Table 5b). For a hybrid to be in the top performance group for these factors it had to equal 62 lb or higher in bushel weight, 18% or less in grain moisture, 5% or less in stalk lodging, and 27,021 ppa in final population. The minimum top performance final population of 27,021 ppa was 97% (27,021/27,878) of the population delivered at planting.

Armour, Tables 5a and b. The test trial yield average (Table 5a) was 124 bu/ac for year 2004 and 105 bu/ac for 2 years (2003-04). Hybrids that yielded 115 bu/ac or more in 2004 and 98 bu/ac or more for 2 years qualified for the top yield group. Hybrids had to differ in yield by 28 bu/ac in 2004 and by 18 bu/ac for 2 years to be significantly different from one another. In 2004, bushel weights averaged 58 lb, grain moisture averaged 16%, lodging averaged 2%, and the final plant population averaged 26,103 ppa (Table 5b). For a hybrid to be in the top performance group for these factors it had to equal 59 lb or higher in bushel weight, 16% or less in grain moisture, 4% or less in stalk lodging, and 26,107 ppa in final population. The minimum top performance final population of 26,107 ppa was 94% (26,107/27,878) of the population delivered at planting.

Late maturity corn tests:

Beresford, Tables 6a and b. The test trial yield average (Table 6a) was 244 bu/ac for year 2004 and 213 bu/ac for 2 years (2003-04). Hybrids that yielded 247 bu/ac or more in

2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 208 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 14 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 58 lb, grain moisture averaged 23%, lodging averaged 2%, and the final plant population averaged 27,388 ppa (Table 6b). For a hybrid to be in the top performance group for these factors it had to equal 59 lb or higher in bushel weight, 21% or less in grain moisture, 4% or less in stalk lodging, and 25,700 ppa in final population. The minimum top performance final population of 25,700 ppa was 92% (25,700/27,878) of the population delivered at planting.

Armour, Tables 6a and b. The test trial yield average (Table 6a) was 125 bu/ac for year 2004 and 98 bu/ac for 2 years (2003-04). Hybrids that yielded 127 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 94 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 28 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 58 lb, grain moisture averaged 19%, lodging averaged 6%, and the final plant population averaged 25,356 ppa (Table 6b). For a hybrid to be in the top performance group for these factors it had to equal 58 lb or higher in bushel weight, 18% or less in grain moisture, 7% or less in stalk lodging, and 25,921 ppa in final population. The minimum top performance final population of 25,921 ppa was 93% (25,921/27,878) of the population delivered at planting.

Performance Trial Results: Roundup Ready™ Hybrids

The performance trial results for 2 years (2003-04) and 1 year (2004) are summarized below.

Northern Locations

Early maturity corn tests:

South Shore, Tables 7a and b. The test trial yield average (Table 7a) was 146 bu/ac for year 2004 and 114 bu/ac for 2 years (2003-04). Hybrids that yielded 147 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years,

even the lowest yield of 109 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 11 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 53 lb, grain moisture averaged 25%, lodging averaged 1%, and the final plant population averaged 27,087 ppa (Table 7b). For a hybrid to be in the top performance group for these factors it had to equal 54 lb or higher in bushel weight, 21% or less in grain moisture, 2% or less in stalk lodging, and 27,282 ppa in final population. The minimum top performance final pop-

ulation of 27,282 ppa was 98% (27,282/27,878) of the population delivered at planting.

Warner, Tables 7a and b. The test trial yield average (Table 7a) was 223 bu/ac for year 2004 and 210 bu/ac for 2 years (2003-04). Hybrids that yielded 225 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 199 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 15 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 59 lb, grain moisture averaged 18%, lodging averaged 2%, and the final plant population averaged 27,177 ppa (Table 7b). For a hybrid to be in the top performance group for these factors it had to equal 59 lb or higher in bushel weight, 18% or less in grain moisture, 3% or less in stalk lodging, and 27,140 ppa in final population. The minimum top performance final population of 27,140 ppa was 97% (27,140/27,878) of the population delivered at planting.

Late maturity corn tests:

South Shore, Tables 8a and b. The test trial yield average (Table 8a) was 134 bu/ac for year 2004 and 104 bu/ac for 2 years (2003-04). Hybrids that yielded 144 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 102 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 11 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 49 lb, grain moisture averaged 31%, lodging averaged 1%, and the final plant population averaged 27,171 ppa (Table 8b). For a hybrid to be in the top performance group for these factors it had to equal 50 lb or higher in bushel weight, 27% or less in grain moisture, 2% or less in stalk lodging, and 26,884 ppa in final population. The minimum top performance final population of 26,884 ppa was 96% (26,884/27,878) of the population delivered at planting.

Warner, Tables 8a and b. The test trial yield average (Table 8a) was 207 bu/ac for year 2004 and 210 bu/ac for 2 years (2003-04). Hybrids that yielded 212 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 207 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 14 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 55 lb, grain moisture averaged 23%, lodging averaged 1%, and the final plant population averaged 27,020 ppa (Table 8b). In order for a hybrid to be in the top performance group for these factors it had to equal 56 lb or higher in bushel weight, 21% or less in grain moisture, 3% or less in stalk lodging, and 26,638

ppa in final population. The minimum top performance final population of 26,638 ppa was 96% (26,638/27,878) of the population delivered at planting.

Central Locations

Early maturity corn tests:

Brookings, Tables 9a and b. The test trial yield average (Table 9a) was 205 bu/ac for year 2004 and 198 bu/ac for 2 years (2003-04). Hybrids that yielded 211 bu/ac or more in 2004 and 208 bu/ac or more for 2 years qualified for the top yield group. Hybrids had to differ in yield by 13 bu/ac in 2004 and by 3 bu/ac for 2 years to be significantly different from one another. In 2004, bushel weights averaged 56 lb, grain moisture averaged 22%, lodging averaged 1%, and the final plant population averaged 27,255 ppa (Table 9b). For a hybrid to be in the top performance group for these factors it had to equal 58 lb or higher in bushel weight, 20% or less in grain moisture, 5% or less in stalk lodging, and 27,171 ppa in final population. The minimum top performance final population of 27,171 ppa was 97% (27,171/27,878) of the population delivered at planting.

Iroquois, Tables 9a and b. The test trial yield average (Table 9a) was 177 bu/ac for year 2004 and 141 bu/ac for 2 years (2003-04). Hybrids that yielded 174 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 134 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 33 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 59 lb, grain moisture averaged 17%, lodging averaged 2%, and the final plant population averaged 26,999 ppa (Table 9b). For a hybrid to be in the top performance group for these factors it had to equal 59 lb or higher in bushel weight, 17% or less in grain moisture, 4% or less in stalk lodging, and 26,955 ppa in final population. The minimum top performance final population of 26,955 ppa was 97% (26,955/27,878) of the population delivered at planting.

Late maturity corn tests:

Brookings, Tables 10a and b. The test trial yield average (Table 10a) was 194 bu/ac for year 2004 and 182 bu/ac for 2 years (2003-04). Hybrids that yielded 205 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 171 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 14 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 51 lb, grain moisture averaged 28%, lodging averaged 1%, and the final plant population averaged 27,349 ppa (Table 10b). For a hybrid to be in the top performance group for these factors it had to equal 52 lb or higher in bushel weight, 24% or less in grain

moisture, 3% or less in stalk lodging, and 26,949 ppa in final population. The minimum top performance final population of 26,949 ppa was 97% (26,949/27,878) of the population delivered at planting.

Iroquois, Tables 10a and b. The test trial yield average (Table 10a) was 190 bu/ac for year 2004 and 140 bu/ac for 2 years (2003-04). Hybrids that yielded 175 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 135 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 37 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 58 lb, grain moisture averaged 18%, lodging averaged 3%, and the final plant population averaged 27,272 ppa (Table 10b). For a hybrid to be in the top performance group for these factors it had to equal 55 lb or higher in bushel weight, 22% or less in grain moisture, 5% or less in stalk lodging, and 27,314 ppa in final population. The minimum top performance final population of 27,314 ppa was 98% (27,314/27,878) of the population delivered at planting.

Southern Locations

Early maturity corn tests:

Beresford, Tables 11a and b. The test trial yield average (Table 11a) was 220 bu/ac for year 2004 and 190 bu/ac for 2 years (2003-04). Hybrids that yielded 229 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 183 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 15 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 60 lb, grain moisture averaged 19%, lodging averaged 1%, and the final plant population averaged 27,270 ppa (Table 11b). For a hybrid to be in the top performance group for these factors it had to equal 60 lb or higher in bushel weight, 18% or less in grain moisture, 3% or less in stalk lodging, and 27,266 ppa in final population. The minimum top performance final population of 27,266 ppa was 98% (27,266/27,878) of the population delivered at planting.

Armour, Tables 11a and b. The test trial yield average (Table 11a) was 116 bu/ac for year 2004 and 102 bu/ac for 2 years (2003-04). Hybrids that yielded 111 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even

the lowest yield of 99 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 24 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 59 lb, grain moisture averaged 16%, lodging averaged 3%, and the final plant population averaged 25,796 ppa (Table 11b). For a hybrid to be in the top performance group for these factors it had to equal 60 lb or higher in bushel weight, 16% or less in grain moisture, 7% or less in stalk lodging, and 25,672 ppa in final population. The minimum top performance final population of 25,672 ppa was 92% (25,672/27,878) of the population delivered at planting.

Late maturity corn tests:

Beresford, Tables 12a and b. The test trial yield average (Table 12a) was 229 bu/ac for year 2004 and 200 bu/ac for 2 years (2003-04). Hybrids that yielded 227 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 192 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 19 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 57 lb, grain moisture averaged 22%, lodging averaged 1%, and the final plant population averaged 27,401 ppa (Table 12b). For a hybrid to be in the top performance group for these factors it had to equal 58 lb or higher in bushel weight, 19% or less in grain moisture, 2% or less in stalk lodging, and 26,572 ppa in final population. The minimum top performance final population of 26,572 ppa was 95% (26,572/27,878) of the population delivered at planting.

Armour, Tables 12a and b. The test trial yield average (Table 12a) was 126 bu/ac for year 2004 and 106 bu/ac for 2 years (2003-04). Hybrids that yielded 122 bu/ac or more in 2004 qualified for the top yield group. Since there were no significant differences in yield in hybrids tested for 2 years, even the lowest yield of 95 bu/ac qualified for the 2-year top yield group. Hybrids had to differ in yield by 29 bu/ac in 2004 to be significantly different from one another, while there were no significant yield differences for hybrids tested 2 years. In 2004, bushel weights averaged 59 lb, grain moisture averaged 17%, lodging averaged 2%, and the final plant population averaged 26,198 ppa (Table 12b). For a hybrid to be in the top performance group for these factors it had to equal 59 lb or higher in bushel weight, 17% or less in grain moisture, 7% or less in stalk lodging, and 26,295 ppa in final population. The minimum top performance final population of 26,295 ppa was 94% (26,295/27,878) of the population delivered at planting.

Table A. Site -Soil classification, percent slope, & previous crop.

Site	Soil type	Seedbed, previous crop
Warner	Great Bend-Putney silt loams, 0-2% sl.	Min-till, s.wheat stubble
South Shore	Brookings sil.cl.loam, 0-3% sl.	Conventional, soybeans
Iroquois	Houdek-Stickney-Dudley, 0-2% sl.	No-till, soybeans
Brookings	Brandt sil. cl., 0-2% sl.	Conventional, soybean
Armour	Highmore silt loam,0-2% sl.	No-till, soybean stubble
Beresford	Egan-Clarno-Trent complex, 0-2% sl.	Conventional, soybean

Table B. Year 2004 trial cooperators, locations, and dates seeded.

Cooperators	Location*	Date Seeded
Allen & Inel Ryckman	Warner	May 5
NE Research Farm	South Shore	May 6
Kirk Aughenbaugh	Iroquois	April 30
SDSU Agronomy Farm	Brookings	May 7
Mark & Cletus Wiechmann	Armour	May 3
SE Research Farm	Beresford	May 4

Plots were all seeded at 27,878 seeds per acre.

Table C. Nearest weather station precipitation and growing degree day (GDD) accumulations for 2004 and their departures from normal (DFN).

Station	Variable	Data is accumulated from April 1 up to the week ending:					
		Apr. 26	May 30	June 27	Aug. 1	Aug. 29	Oct. 3

* RM= relative maturity reported by seed company.

Seeding dates: Brookings- May 7 and Iroquois- April 30, 2004.

Lsd= amount values in a column must differ to be significantly different.

NS indicates differences among values in a column are non-significant.

TPG-value= minimum value to qualify for top performance group.

@ Coef. of variation= a measure of trial experimental error, 15% or less is best.

* RM= relative maturity reported by seed company.

Seeding dates: Beresford- May 4 and Armour- May 3, 2004.

Lsd= amount values in a column must differ to be significantly different.

NS indicates differences among values in a column are non-significant.

TPG-value= minimum value to qualify for top performance group.

@ Coef. of variation= a measure of trial experimental error.

* RM= relative maturity reported by seed company.

Seeding dates: Beresford- May 4 and Armour- May 3, 2004.

Lsd= amount values in a column must differ to be significantly different.

NS indicates differences among values in a column are non-significant.

TPG-value= minimum value to qualify for top performance group.

@ Coef. of variation= a measure of trial experimental error, 15% or less is best.
